TRACK USE ONLY

TIRE PRESSURE RECOMMENDATIONS

- Tire pressures should be carefully established, especially when running your motorcycle on the track.
- Always refer to the motorcycle manufacturer's recommendations for track usage and tire pressures.
- Motorcycle tires intended for track usage ("race tires") have temperatures and pressures at which they function best, which vary according to the circumstances. For specific Bridgestone tires when used on the track, you may use the information in this chart as a reference.

- Make adjustments to front and/or rear pressures based on the following:
 Motorcycle type and setup
 Track conditions, including surface condition and ambient temperature - Your riding experience
- Ride more carefully until your tires warm up to operating temperature.
- Tires intended for ordinary street/highway usage ("street tires") do not perform the same as race tires, and have different operating temperatures. Using street tires on the track may void the tire manufacturer warranty.

Use of HYPERSPORT patterns on track. Reminder: "Street Use" tires do not have the same optimum operating temperature as racing tires (Operating temperature is lower). Therefore it is important to adapt tire pressure accordingly. HYPERSPORT tires are not designed for pure track use only and therefore it may only be appropriate for beginne intermediate experienced riders. The recommended pressures are for track use only. If you are using these tires on the road, refer to the vehicle manufacturer's recommend.
